

Deactivating Security Pack Mode

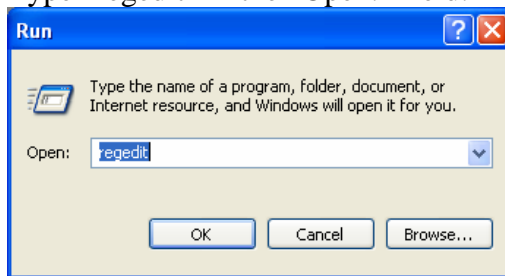

Security Pack mode is controlled by a registry setting that ASTRA checks when starting up. If the registry key is not present, ASTRA will boot in “normal” mode and bypass the authentication and SQL Database connection.

To remove the Security Pack feature, you will need security privileges to make updates to the registry. This usually means that you will need “Local Administrator” rights on the workstation.

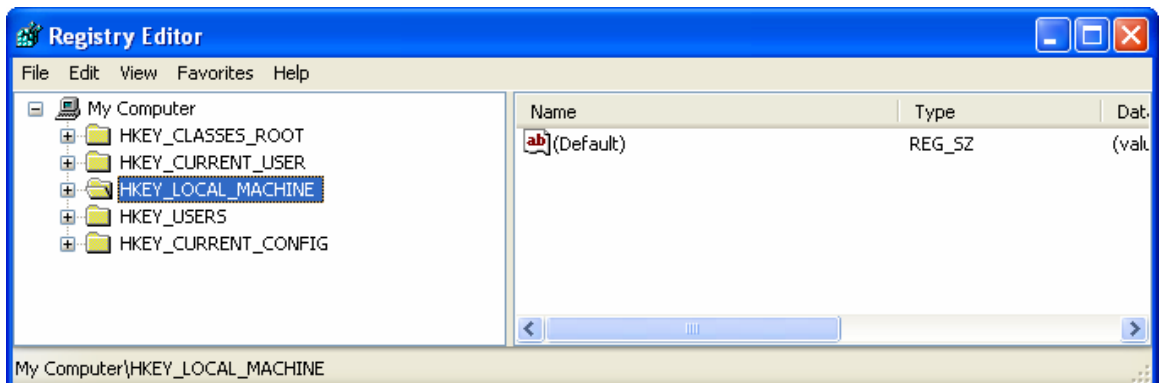

1. Launch the Registry Editor:
 - a. From the “Start” menu, select the “Run” option:

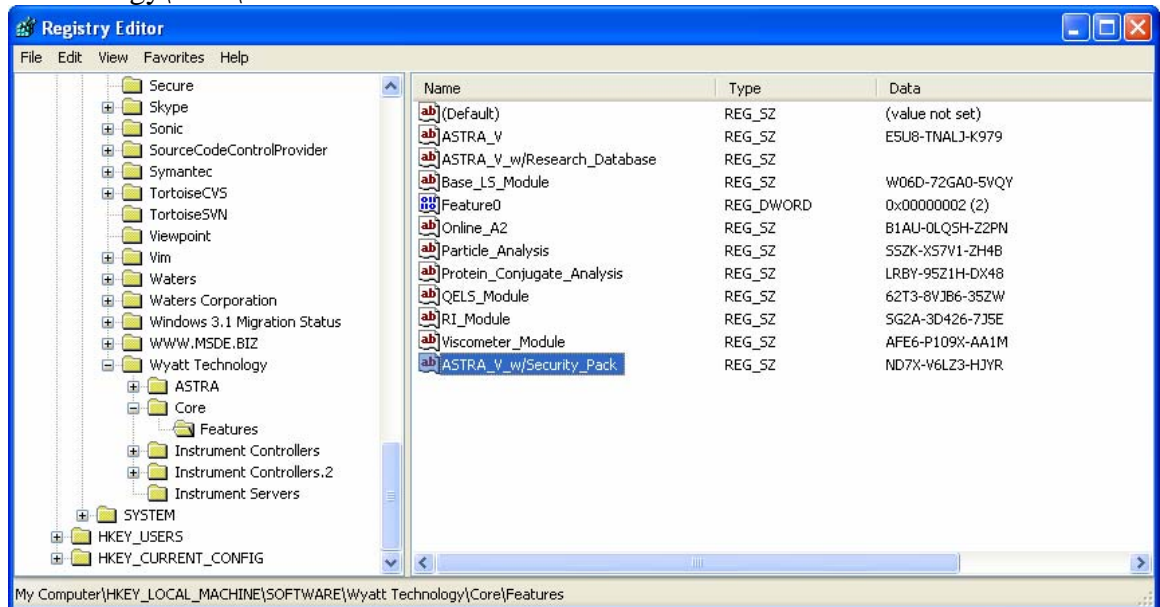

- b. Type “regedit” in the “Open:” field:

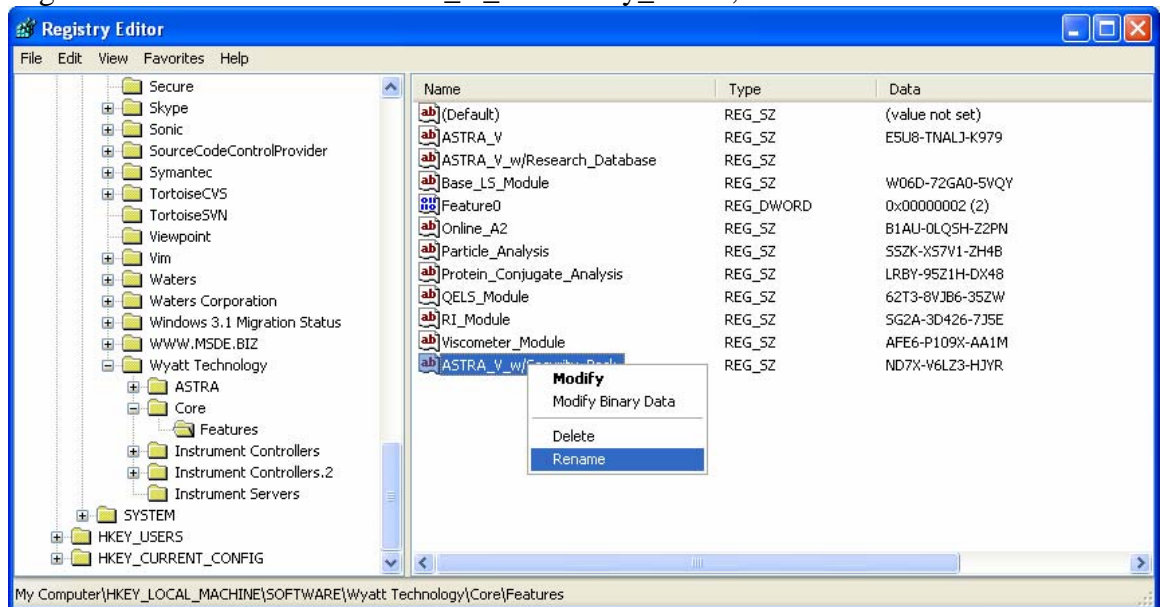

2. The Registry Editor will launch.

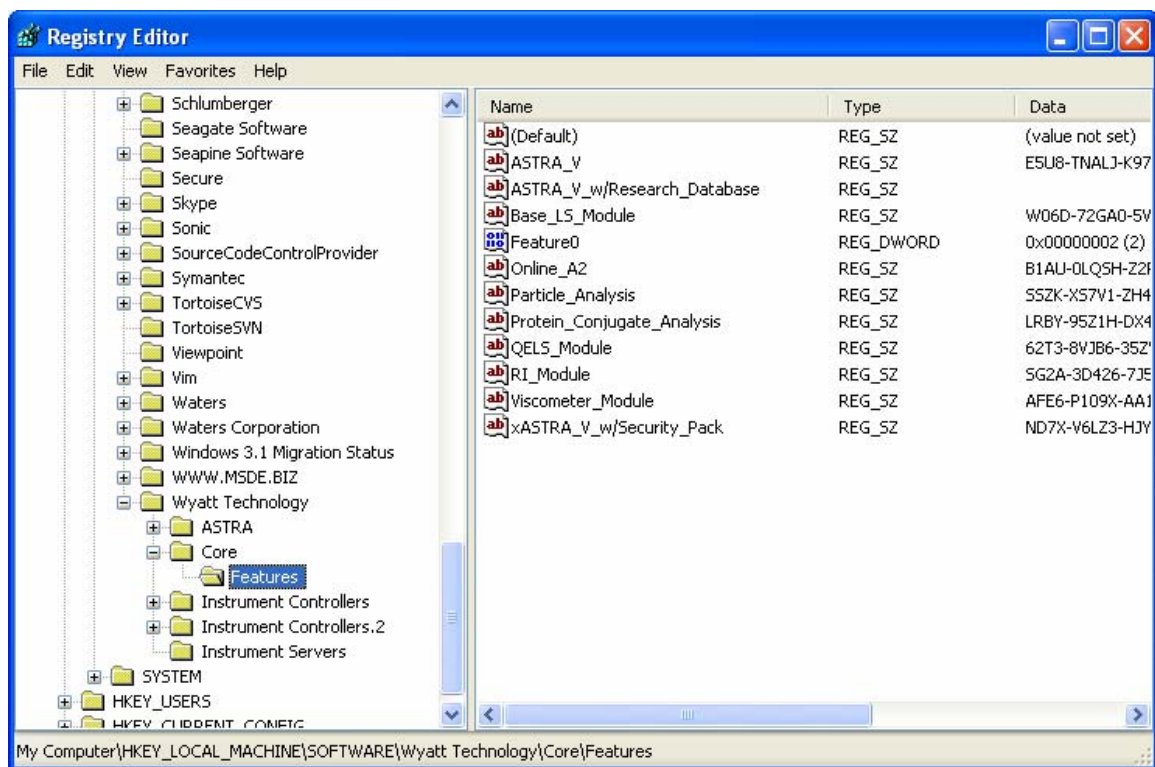

3. Navigate to the key: “My Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Wyatt Technology\Core\Features”:

4. Right-click on the value “ASTRA_V_w/Security_Pack”, and select “Rename”:

5. Place an ‘x’ at the front of the name, so that it looks like the following:

6. When you start up ASTRA, it should boot in “Normal” mode.
